Cruise: Weather radars usually have a beam width of around 2.5 deg. Setting the tilt control to around 1deg down (relative to the external horizon) will allow you to observe weather ahead and slightly below the aircraft. If your radar allows multiple elevation scans, then it is

prudent to select a pattern that spends some time looking lower than the aircraft to give yourself the best chance of identifying developing weather systems, thus allowing you to take early avoiding action.

Weather Radar: Storm Avoidance - SKYbrary Aviation Safety

For purposes of airborne weather radar, a narrow beam is the most desirable because it concentrates more energy on the target, which means more energy will come back in the echo. Flat Plate antennas are better than dish antennas and larger antennas are better than smaller antennas for concentrating the beam.
