Now to step back for a moment: cosmic rays are high-energy charged particles from outer space, unique messengers from distant sources (and were discussed in this earlier 2019 KIPAC research highlight by Noemie Globus). First detected more than a century ago, the origin of these mysterious particles is still not fully understood because their trajectories easily bend in magnetic fields, making it difficult to track them back to their source.

An extreme-energy cosmic ray is an UHECR with energy exceeding  $5 \times 10^{19}$  eV, the so-called Greisen-Zatsepin-Kuzmin limit. This limit should be the maximum energy of cosmic ray protons that have traveled long distances, since higher-energy protons would have lost energy over that distance due to scattering from photons in the cosmic microwave background. It follows that EECR could not be survivors from the early universe,
