Welcome to Practical Time Series Analysis! Many of us are "accidental" data analysts. We trained in the sciences, business, or engineering and then found ourselves confronted with data for which we have no formal analytic training. This course is designed for people with some technical competencies who would like more than a "cookbook" approach, but who still need to concentrate on the routine sorts of presentation and analysis that deepen the understanding of our professional topics.

The Prophet uses a decomposable time series model with three main model components: trend, seasonality, and holidays. They are combined in the following equation: $y(t) = g(t) + s(t) + h(t) + \epsilon_t$. $g(t)$: piecewise linear or logistic growth curve for modeling non-periodic changes in time series.

RFE works in 3 broad steps: Step 1: Build a ML model on a training dataset and estimate the feature importances on the test dataset. Step 2: Keeping priority to the most important variables, iterate through by building models of given subset sizes, that is, subgroups of most important predictors determined from step 1.

Caret Package - A Practical Guide to Machine Learning in R

Abstract. Two different approaches, called Type-I and Type-II, to linear least-squares prediction of a long-memory time series are distinguished. In the former, no new theory is required and a long-memory time series is treated on par with a standard shortmemory time series and its multistep predictions are obtained by using the existing modelling approaches to prediction of such time series.

Prediction of Long-Memory Time Series: A Tutorial Review ...

The interrupted time series design A time series is a continuous sequence of observations on a population, taken repeatedly (normally at equal intervals) over time. In an ITS study, a time series

of a particular outcome of interest is used to establish an underlying trend,

which is 'interrupted' by an intervention at a known point in time.
