Electromagnetic methods in applied geophysics | SpringerLink

In applied geophysics, the term is usually used to refer to methods that use a low frequency time-varying magnetic field as a source to excite

electrical currents in the ground through the principle of electromagnetic induction. These methods are sensitive to the electrical conductivity of the subsurface. The GPR, DC resistivity and induced polarization methods are also governed by the laws of electromagnetism but excite the earth differently enough that they are classified separately.

Exploration geophysics is an applied branch of geophysics and economic geology, which uses physical methods, such as seismic, gravitational, magnetic, electrical and electromagnetic at the surface of the Earth to measure the physical properties of the subsurface, along with the anomalies in those properties. It is most often used to detect or infer the presence and position of economically useful geological deposits, such as ore minerals; fossil fuels and other hydrocarbons; geothermal reservoir

Exploration geophysics - Wikipedia

Natural-source Audio-frequency Magnetotellurics (AMT) is an

electromagnetic survey technique that uses naturally-occurring ionospheric currents and lightning storms — passive energy sources — to electrically map geologic structure to depths of 500 meters or more. Natural-source electromagnetic (EM) signals are generated in the atmosphere and magnetosphere.

Introduction to AMT

Transient electromagnetics, (also time-domain electromagnetics / TDEM), is a geophysical exploration technique in which electric and magnetic fields are induced by transient pulses of electric current and the subsequent decay response measured. TEM / TDEM methods are generally able to determine subsurface electrical properties, but are
