A property of linear PDEs is that if two functions are each a solution to a PDE, then the sum of the two functions is also a solution of the PDE. This property of superposition can be used to derive solutions for general boundary, initial conditions, or distribution of sources by the process of convolution with a Green's function.

The solution is thus $u(x, t) = A e^{i(kx + k^3 t)} = A e^{i k(x + k^2 t)}$. The dispersion relation is real so the PDE is dispersive. Taking the real part we get $u(x, t) = A \cos(k(x + k^2 t))$, which is a left traveling wave moving with speed k^2 . Waves with larger wave number move faster.
