to achieve the best possible separation of the black marker pigments using paper chromatography. Paper chromatography uses capillary force that move water or another solvent and the sample up the paper strip. The most soluble compounds of the sample will go farther the less soluble will stay at the start line. Using chromatography we can find out how many components are in paint, inks, markers as well as in natural dyes, leaf extracts.

Chromatography Experiment with Permanent Markers. In experiment #1 above, we used water to separate colors from markers, but this time we are tackling permanent markers. Permanent markers are water-insoluble (that's what makes them permanent), so we know that water is not going to get the job done. We looked around the house and gathered up rubbing alcohol, nail polish remover, and vinegar to see if they will help us separate colors in permanent markers.

The ink in the black marker consists of several pigments dissolved in a solvent containing some water and alcohol. At the end of the experiment, we can see each of these separate pigments on the filter paper. The black circle is moistened with sodium hydrogen sulfate NaHSO_4 , which gradually spreads along the paper.
