higher the voltage, the higher the rate of electrolysis. This statement can be justified as point 1 at the 2 volts had an increase of 0.025g, whilst point 4 at 8 volts had in increase of 0.04g and point 5 at 10 volts increased 0.05g. The results above supports my hypothesis that the higher the voltage the faster the rate of electrolysis

To use electrolysis to determine the equivalent mass of an unknown metal. In a previous lab you determined the equivalent mass (EM) of an unknown acid by titrating it with a standardized NaOH solution. For that procedure the equivalent mass of the acid was defined as the mass of acid that produced one mole of H^+ :
