The cantilever beam is one of the most
 simple structures. It features only one
 support, at one of its ends. The support
 is a, so called, fixed support that inhibits
 all movement, including vertical or
 horizontal displacements as well as any
 rotations. The other end is unsupported,
 and therefore it is free to move or rotate.

The bending moment of a cantilever beam is maximum at the fixed end and decreases to zero at the free end. The bending and shear force diagram is determined for all possible load combinations to design a cantilever beam for a structure. The load applied on the beam is a combination of dead load and live loads as per the design standards.

Fixing moment is the moment generated at the fixed end of the beam in order to prevent any rotational motion. Fixed end of the cantilever neither allows rotational nor translational motion. Translational motion is restricted by reaction force at fixed end . To prevent any rotational motion the net moment at the fixed end has to be ZERO. To achieve this a moment is produced at the fixed end that is equal and opposite to the applied bending moment at that point. if there is no external load the ...
