Energy modeling or energy system modeling is the process of building

computer models of energy systems in order to analyze them. Such models often employ scenario analysis to investigate different assumptions about the technical and economic conditions at play. Outputs may include the system feasibility, greenhouse gas emissions, cumulative financial costs, natural resource use, and energy efficiency of the system under investigation. A wide range of techniques are employed, ranging from broadly

In general, a condition of a linear system can be determined in terms of excitations $x_n(t)$ and responses $y_n(t)$.

$$x_1(t) + x_2(t) + \dots + x_n(t) = y_1(t) + y_2(t) + \dots + y_n(t)$$

Mathematical Modeling of Systems - Engineering

Many important engineering problems may be solved and the behaviour of many electrical systems may be understood by using mathematical modeling. Thus the electrical systems may often be described, with sufficient accuracy for engineering purposes, by a set of ideal lumped elements which represent essential electrical phenomena.
