However, the mathematical analysis of biophysically realistic neuron models such as the 4-dimensional Hodgkin-Huxley (HH) and the 2-dimensional Morris-Lecar (ML) equations is difficult, as a result of a large parameter space, strong nonlinearities, and a high dimensional phase space of the model equations. The search for simpler, mathematically tractable (small parameter space, weaker nonlinearities, low dimensional phase space) neuron models that still capture all, or at least some ...

Stochastic Neuron Models: Greenwood, Priscilla E., Ward ...

Neuron models seem to come in three types: binary, threshold, and dynamical. We indicate some of the potential problems for probabilists associated with each type. In each case we first describe the deterministic model and its characteristics and then indicate how introducing noise, or stochasticity, into the model affects its behavior.

A stochastic model for describing the firing activity of a couple of interacting neurons subject to time-dependent stimuli is proposed. Two stochastic differential equations suitably coupled and including periodic terms to represent stimuli imposed to one or both neurons are considered to describe the problem.
