High Pressure Shock Compression **Of**

The Hugoniot is the result of adiabatic, irreversible shock compression, resulting in a high-temperature state and a pressure offset from the isotherm and isentrope that increases with compression. At lower pressures where shock heating is small, the Hugoniot lies close to the isentrope (neglecting strength effects), but the curves diverge increasingly at higher pressure (Figure 3).

An estimated strength of 435 MPa is obtained, for a strain rate of $1.3 \times 10^7 \text{ s}^{-1}$. The threshold stress for deformation twinning in shock compression is calculated from the constitutive equations for slip, twinning, and the Swegle-Grady relationship. The calculated threshold pressure for the orientation is 16.3 GPa.
