How Can an Insulator be Polarized? Polarization can occur within insulators, but the process occurs in a different manner than it does within a conductor. In a conducting object, electrons are induced into movement across the surface of the conductor from one side of the object to the opposite side.

The shallow electron penetration depth arising from the strong coulombic interaction is advantageous for separating surface behavior from the normally overwhelming bulk. Therefore, the use of transversally polarized electron beams allows the determination of in-plane surface magnetization directions.

Electrons are set to oscillation by the incoming light wave and therefore some of the wave energy of the light gets transferred to the electrons to be dissipated or reflected by the electrons. Polarizing filters used in sunglasses contain molecules which make it is easy for the electrons to oscillate in the horizontal direction (long direction) thus dissipating more horizontally polarized light energy.
