Optical Design Of Laser Beam

Beam-expander design concepts are derived from the fundamental principles of telescope design. When a collimated laser beam is input to one side of the beam expander, a collimated beam is output from the other end—that is, the object space and image space rays converge at infinity. This characteristic defines a beam expander as an afocal system.

Optical Design: How to select the right laser beam ...

Using geometrical methods for the

optical design of laser beam shaping systems involves incorporating the geometrical optics intensity law for propagation a bundle of rays (conservation of energy) and the constant optical path length condition into the ray trace equations for the optical system, and then, determining the geometrical shapes of several optical surfaces (or GRIN materials) so that the beam shaping design conditions are satisfied.

Optical Design of Laser Beam Shaping Systems

When diffraction effects are not important, geometrical methods for laser beam shaping (ray tracing, conservation of energy within a bundle of rays, and the constant optical path length condition) can be used to determine system configurations, including aspheric elements and spherical-surface GRIN lenses, which are required to change the intensity profile into a more useful form.

Optical design of laser beam shaping systems

Abstract Control of the optical fields of laser beams, i.e., laser beam shaping, is of great importance to many laser applications. Freeform optics offers plenty of advantages for complex beam shaping requirements, including precise beam control, energy efficiency, compact structure, and relatively low cost.

Examples of the application of the Galilean telescope design to laser beam expanders can be found in several Edmund Optics products, all of which can be used to collimate and focus laser beams. Our TECHSPEC® Arcturus HeNe Beam Expanders is a simple two-lens design, consisting of a negative lens and achromatic lens. Drawing of the internal optical elements is shown for reference.

Laser Beam Expanders | Edmund Optics

Finally, we assumed the laser was a Helium Neon (HeNe) design and optimized for a design wavelength of 632.8nm. Since beam expanders are afocal systems, make sure “afocal image

space" is checked in the Zemax lens data editor. This will change the units of the metrics to be angular rather than distances.

How to Design your own Beam Expander Using Stock Optics

Unstable laser resonators (not used in most lasers) produce fractal-shaped beams. Specialized optical systems can produce more complex beam geometries, such as Bessel beams and optical vortexes. Near the "waist" (or focal region) of a laser beam, it is highly collimated: the wavefronts are planar, normal to the direction of propagation, with no beam divergence at that point.

Laser - Wikipedia

elements and optical systems have been

developed for laser beam shaping. Hoffnagle et al. [1] described a refractive beam shaper which can be used to sort the light into a flat-top distribution using two specially designed aspherical lenses. The disadvantages of such systems are the strict dependence on the entrance profile and the proper alignment. Alignment errors and fluctuations of the laser beam have a strong influence on the achieved uniformity.

Laser Beam Homogenizing: Limitations and Constraints

05 Nov 2020. Anamorphic beam shaping optics are used to transform elliptical laser beams to a round shape - for example before coupling them to single mode optical fibers. Conversely, there are cases where originally round laser

beams need to be transformed into an elliptical shape. Schäfer+Kirchhoff uses two cylinder lenses acting in as a Galileo's telescope in one direction.
