In this introductory talk, we first revisit with proof for illustration purposes some basic properties of a specific system of orthogonal polynomials, namely the Chebyshev polynomials of the first kind. Then we define the notion of orthogonal polynomials and provide with proof some basic properties such as: The uniqueness of a family of orthogonal polynomials with respect to a weight (up to a multiplicative factor), the matrix representation, the three-term recurrence

An Orthogonal Polynomial Sequence (OPS) is a sequence of polynomials $P_n(x)$ such that P_n has degree n and any two polynomials are orthogonal. Here the inner product is defined in terms of a given linear functional L , so that $L(P_n P_m) = 0$ if and only if $n \neq m$.

Abstract. An elementary non-technical introduction to group

representations and orthogonal polynomials is given. Orthogonality relations for the spherical functions for the rotation groups in Euclidean space (ultraspherical polynomials), and the matrix elements of $SU(2)$ (Jacobi polynomials) are discussed. A general theory for finite groups acting on graphs, giving a finite set of discrete orthogonal polynomials is given.

Legendre polynomials are named after French

mathematician Adrien-Marie Legendre (1752 – 1833) who discovered them in 1782. They are a complete set of orthogonal polynomials, with rich mathematical properties, and many applications.

1. Legendre polynomials - An easy introduction

Polynomials are an orthogonal basis for all polynomials of degree k or less. These polynomials are very special in many ways.

Orthogonal Polynomials

Orthogonal polynomials We start with Definition 1. A sequence of polynomials $f_n(x)$ $n=0$ with $\deg[f_n(x)] = n$ for each n is called orthogonal with respect to the weight

function $w(x)$ on the interval $(a;b)$ with $a < b$
