01/30/2019. The book has three parts that are quite independent from each other. The first part, "Divisors", consists of five chapters focusing on the dollar game, in which vertices of a graph lend money to each other, with the goal of all vertices becoming debt-free by the end of the game. In this context, a divisor is just an element of the free abelian group on the vertices of the graph.

We think of each

Configurations and divisors¶. A configuration on Γ is an element of $\mathbb{Z}_{\geq 0} \tilde{V}$, i.e., the assignment of a nonnegative integer to each nonsink vertex. We think of each integer as a number of grains of sand being placed at the corresponding vertex. A divisor on Γ is an element of $\mathbb{Z} V$, i.e., an element in the free abelian group on all of the vertices.
