Regret Minimization Algorithms And Applications

Regret is the de-facto standard in measuring performance of learning algorithms. 1 Intuitively, an algorithm performs well if its regret is sublinear as a function of T , i.e. $\text{Regret } T(A) = o(T)$, since this implies that “on the average” the algorithm performs as well as the best fixed strategy in hindsight.

The convex optimization approach to regret minimization

Such a relationship opens a door to a decomposition scheme, called progressive hedging, for solving multistage risk minimization and regret minimization problems. In particular, the classical progressive hedging algorithm is modified in order to handle a new class of linkage constraints that arises from reformulations and other applications of risk and regret minimization problems.

The regret minimization rule performs regret minimization

between stock and cash. It is defined by the update equations $w_{s,t+1} = w_{s,t} f(r_t)$, and $w_{c,t+1} = w_{c,t}$, where $f : \mathbb{R} \rightarrow \mathbb{R}_+$. In what follows, we use $f(r_t) = 1 + \eta r_t$, which is the regret minimization rule of the Polynomial Weights algorithm [25], as adapted in [35].

Machine Learning Algorithms with Applications in Finance

Some of the most compelling applications of online convex optimization, including online prediction and classification, are unconstrained: the natural feasible set is $\mathbb{R}^n$. Existing algorithms fail to achieve sub-linear regret in this setting unless constraints on the comparator point are known in advance. We present algo-

A survey: The convex optimization approach to regret ...

Abstract In recent years convex optimization and the notion of regret minimization in games have been combined and applied to machine learning in a general framework called online convex optimization. We will survey the basics of this framework, its applications, main algorithmic techniques and future research directions.

As a result, regret minimizing algorithms in self-play can be used as a technique for computing an approximate Nash equilibrium. Moreover, an algorithm's bounds on the average overall regret bounds the rate of convergence of the approximation. Traditionally, regret minimization has focused on bandit problems more akin to normal-form games.

Regret Minimization in Games with Incomplete Information

The Jeff Bezos Regret Minimization Framework

Spurred by the enthusiasm surrounding the "Big Data" paradigm, the mathematical and algorithmic tools of online optimization have found widespread use in problems where the trade-off between data exploration and exploitation plays a predominant role. This trade-off is of particular importance to several branches

These guarantees are based on Hannan's definition of regret, a seminal notion which compares an algorithm's performance to that of the best fixed policy in hindsight, an idealized benchmark that minimizes the total loss incurred over the horizon of play with perfect knowledge of the future. Bandit Optimization: Theory and Applications

The aim for the external regret setting is to design an online algorithm that will be able to approach the performance of the best algorithm from a given class of algorithms G ; namely, to have a loss close to $\min_{g \in G} \sum_{t=1}^T \ell_t(g)$.

Learning, Regret minimization, and Equilibria

In regret-minimization algorithms, a strategy is determined through an iterative process. While there are a number of such algorithms (e.g., (Greenwald, Li, and Marks 2006; Gordon 2007)), this paper will focus on a typical one called regret matching (specifically, the polynomially weighted average forecaster with polynomial degree 2).
