Non Crimp Fabric Composites Manufacturing

The focus in this
chapter is on the
production of warp-
knitted non-crimp
fabrics. The production
process of coursewise
and non-coursewise
biaxial and multiaxial
warp-knitted NCF is
described in detail and
the production of non-
crimp fabrics by means
of weft knitting with
weft insertion and
specially adapted
weaving processes is
explained.

faster and cheaper preforms production processes than unilayer based processes. It also has advantages for LCM (Liquid Composite Moulding) methods as NCF present better drappability due to the good deformability of unidirectional plies versus woven fabrics that are undulated (crimp).

Composites based on these non-crimp 3D orthogonal fabrics have been shown to have about 10-15% higher in-plane tensile strengths compared to an equivalent laminate of 2D woven fabrics. Since compression tends to separate layers, the advantage in compressive

strength is greater, on the order of 25%.

Non-Crimp Fabric Composites | ScienceDirect

Non-Crimp Fabric composites can trace their early steps to the marine industry and it was first manufactured in 1983 in terms of a +45° ply knitted together with a -45° ply to form a double bias fabric. As mentioned earlier, one of the main reasons for the industry to use NCF composites instead of UDPT laminates are the economical benefits.
