Basics of Amorphous and Amorphous Solid Dispersions

Although the majority of new drug candidates suffer from poor solubility and bioavailability, oral solid dosage forms remain the preferred route of administration due to their ease of use and convenience for patients and caregivers. In recent years, numerous drugs formulated as amorphous solid dispersions (ASDs) have been successfully commercialized, confirming the effectiveness of these technologies for enhancing the dissolution of challenging APIs.

The Coming of Age of Amorphous Solid Dispersions

A solid dispersion (SD) is defined as the dispersion of a drug compound in a carrier matrix (often polymers) at solid state. In the case of an ASD, a crystalline form of the compound is converted to an amorphous form, which is dispersed in, and stabilised by, a carrier.

Solving solubility issues with amorphous solid dispersions

Professor Zografi's research interests have been focused in three scientific areas related to drug product development: the physical chemical properties of amorphous solids and amorphous solid dispersions; the hygroscopic properties of solids and their impact on physical and chemical instabilities; and the surface chemistry of lipids, polymers, and proteins in monolayer and bilayer systems (Fig. 1). Professor Zografi's long and distinguished career included mentoring 26 Ph.D. and 20 M.S ...

Amorphous dispersions. If the solubility of a drug is insufficient and suitable salts or co-crystals cannot be produced, you may need to formulate a drug in its amorphous state, since the solubility will be higher than that of the crystalline substance. A way to kinetically stabilize the amorphous state is to form so-called amorphous dispersions, where the active ingredient is molecularly dispersed in a glassy polymer matrix.

Solid State Development - Amorphous Dispersions ...

Amorphous solid dispersions are being used more frequently in the pharmaceutical industry to address bioavailability problems with poorly soluble drugs. Since amorphous dispersions are

inherently metastable, there is always a possibility that the drug will convert to the more stable crystalline form, resulting in decreased bioavailability.

Characterizing Miscibility in Amorphous Solid Dispersions ...

Several drug-processing technologies have been employed to synthesize amorphous SDs, such as hot melt extrusion (HME), Kinetisol®, spray drying, supercritical fluid technology, and electrostatic spinning [,,,]. The selection of these methods depends on the nature of the end product.

Manufacturing strategies to develop amorphous solid ...

Polymer-based formulations, so-called amorphous solid dispersions (ASDs), are often produced via solvent-based processes. In such processes, active pharmaceutical ingredients (APIs) and polymers are first dissolved in a solvent or solvent mixture, then the solvent is evaporated, for example, via spray drying or rotary evaporation.

Thermodynamic Modeling of Solvent-Impact on Phase ...

Within this context, amorphous solid dispersions (ASDs) have emerged as the technology of choice for improving bioavailability, driven mainly by the technology's applicability across a diverse compound property space and its scalable manufacturing processes, offering the flexibility and control needed for an optimized drug product. 1,2
