Single-photon emission computerized tomography (SPECT) scans use radioactive materials and a specially designed gamma camera to produce three-dimensional images of the inside of your organs. This type of imaging provides a non-invasive way for doctors to evaluate the health of certain parts of your body, most commonly the heart, brain, and bones.

SPECT Scan: Uses, Side Effects, Procedure, Results

A SPECT scan is a type of nuclear imaging test, which means it uses a radioactive substance and a special camera to create 3-D pictures. While imaging tests such as X-rays can show what the structures inside your body look like, a SPECT scan produces images that show how your organs work.

SPECT scan - Mayo Clinic

A myocardial perfusion SPECT (Single Photon Emission Computed Tomography) study, also called a cardiac stress-rest test, is used to evaluate the heart's blood supply. Two sets of images showing blood flow are obtained: the first following a period of rest, and the second following a period of stress,

which involves exercise on a treadmill.

Cardiac imaging: A SPECT scan can also aid in capturing detailed images of how well your heart is working and potentially pinpoint the problems occurring within the heart. The scan can help a doctor determine if a patient has clogged arteries, scar tissue due to a heart attack, inefficient pumping of the blood, and whether bypass surgery is needed to remedy any of these issues.

SPECT imaging performed after stress reveals the distribution of the radiopharmaceutical, and therefore the relative blood flow to the different regions of the myocardium. Diagnosis is made by comparing stress images to a further set of images obtained at rest which are normally acquired prior to the stress images.

SPECT myocardial perfusion imaging (MPI) is a non-invasive imaging technique to evaluate the presence and severity of coronary artery disease (CAD) by detecting flow-limiting disease, risk-stratifying patients, and assessing and quantifying patient risk. Cardiac imaging modalities can be divided into 2 broad groups, though some overlap does exist (Figure 1). Modalities such as CTA and CMR angiography provide primarily anatomical data, allowing for the assessment of coronary stenosis. Alternatively, functional imaging modalities such as SPECT, PET, CMR, and stress ECHO provide measures of ischemia.
