Embedded System and Its Real Time Applications

An embedded system is a computer system designed to perform one or a few dedicated functions often with real time computing constraints. It is embedded as part of a complete device often including hardware and mechanical parts. By contrast, a general-purpose computer, such as a personal computer (PC), is designed to be flexible and to meet a wide range of end-user needs.

Tutorial : What Is Embedded And Real Time Systems

A real-time computer system may be a component of a larger system in which it is embedded; reasonably, such a computer component is called an embedded system. Applications and examples of real-time systems are ubiquitous and proliferating, appearing as part of our commercial, government, military, medical, educational, and cultural infrastructures.

What Are Real-Time Embedded Systems

An even more significant development in the world of real-time embedded systems design was the Motorola 68000 series whose instruction set allowed the easy partitioning of user and system stacks. This new instruction set also introduced a rich orthogonal set of set of pointer based address modes across what had grown to five 16 bit base ...
