The methods used for analysis of frame are:

1. Flexibility coefficient method.
2. Slope displacement method.
3. Iterative methods like.
 - a. Moment distribution method (By Hardy Cross in 1930's)
 - b. Kani's method (by Gasper Kani in 1940's)
4. Approximate methods like.
 - a. Substitute frame method.
 - b. Portal method.
 - c. Cantilever method.

1. FLEXIBILITY COEFFICIENT METHOD:

**METHOD OF
ANALYSIS OF
FRAMES | CIVIL
ENGINEERING**

Kani's Method . It involves distributing the unknown fixed end moments of structural members to adjacent joints, in order to satisfy the conditions of continuity of slopes and displacements. The most important feature of Kani's method is that it is self-corrective. Any error at any stage of iteration is corrected in subsequent steps.

feature of KANI'S method is that the process is self-corrective. Any error at any stage of iteration is corrected in subsequent steps. Framed structures are rarely symmetric and subjected to side sway, hence KANI'S method is best and much simpler than other methods like moment distribution method and slope displacement method. General Slope deflection equations are: $M_{ab} = M_{Fab} + \frac{2EI}{L} (-2\theta_a - \theta_b) \rightarrow (1)$

Analysis of Multi-Storeyed Building

This method was first developed by Prof.

Gasper Kani of Germany in the year 1947. The method is named after him. This is an indirect extension of slope deflection method. This is an efficient method due to simplicity of moment distribution. The method offers an iterative scheme for applying slope deflection method of structural analysis.

Kani's method of analyzing indeterminate structures, particularly, building frames was developed in Germany in the year 1947 by Dr. Gasper Kani. Like moment distribution it is a method of solving slope deflection

equations by an iterative method.
