Chapter 3 Microstrip Patch Antenna

In its most basic form, a Microstrip patch antenna consists of a radiating patch on one side of a dielectric substrate which has a ground plane on the other side as shown in Figure 3.1. The patch is generally made of

conducting material such as copper or gold and can take any possible shape.

They will be referred to as conventional antennas. The simplest and most widely used antenna element is the half-wave dipole, which consists of two linear conductors about a quarter wave long, driven by a source at the center, as shown ...

Microstrip Patch Antennas: Second Edition (687 Pages)

Rectangular patch antennas are

notoriously narrowband; the bandwidth of rectangular microstrip antennas are typically 3%. Secondly, the microstrip antenna was designed to operate at 100 MHz, but it is resonant at approximately 96 MHz. This shift is due to fringing fields around the antenna, which makes the patch seem longer.
