Oxidation process is mainly carried out in the pure O₂ (Dry oxidation) or mixture of O₂ and H₂O vapor (Wet oxidation) enclosed environment at temperature range from 800oC to 1200oC. The major difference in the growth of wet and dry oxide is the growth rate; dry oxide grows much slower than wet oxide.

Furnace - Oxidation (Wet / Dry)

Wet oxidation is preferred to dry oxidation for growing thick oxides, because of the higher growth rate. However, fast oxidation leaves more dangling bonds at the silicon interface, which produce quantum states for electrons and allow current to leak along the interface. (This is called a "dirty" interface.)

Horizontal hot-wall furnace load station. Both dry and wet thermal oxide films can be produced using batch processing and resistively heated tube furnaces. These furnaces can be configured as either "horizontal hot-wall" or "vertical hot-wall" furnaces. Horizontal and vertical furnace systems are ubiquitous in older

The oxidation rate increases with the hydrostatic pressure in the furnace for dry and wet oxidation in nearly the same way. The principal advantages of higher pressure oxidation over conventional atmospheric oxidation are the faster oxidation rate (see Fig. 2.13) and the lower processing temperature generally employed [35, 36].

2.4 Oxidation Parameters

Dry and Wet Oxidation Koyo Thermo Systems has well developed furnace versions for dry and wet oxidation. Thin gate oxides can be prepared with a very high uniformity over the wafer and from wafer to wafer. Thicker field oxides or oxides used for masking can be grown

faster by wet oxidation.

Thermal processes in semiconductor technology

Water vapor is a key ingredient in the wet oxidation recipe. During a typical process, a furnace containing multiple wafers is flooded with water vapor. The oxygen in the water molecule reacts within the silicon wafer to form silicon dioxide. This is a sacrificial process, where the original substrate is reduced as the oxide forms on its surface.

Thermal Oxidation Pure Wafer thermal oxide furnaces are certified for growing oxide on wafers of 100 mm to 300 mm in diameter. We guarantee a $\pm 5\%$ percent

industry-standard uniformity across every batch, but typically our processed wafers qualify at a far better rate, enabling us to meet the tightest of customer specifications.

The AP furnaces provide dry/wet oxidation, dopant diffusion, annealing, and sintering process, which are transport dominant, i.e. the reaction rate is controlled by the transportation and/or diffusion of reactants into the substrate. This means the reaction rate is usually not linear, and most often decreases with time.

To grow this coating, wafers undergo wet or dry thermal oxide inside a quartz furnace. It is important to use a clean quartz furnace to protect the wafers from particles in the surrounding environment. Not finding what you're looking for? Wet oxidation creates oxides on the (110) surface 72-135% thicker than those on the (100) surface. Oxidation on batch furnaces Process temperature was found to have a very weak impact on within-wafer uniformity and a strong effect on oxidation rates.
