Association studies can determine whether a genetic variant is associated with a disease or trait. A tag SNP is a representative single-nucleotide polymorphism in a region of the genome with high linkage disequilibrium (the non-random association of alleles at two or more loci). Tag SNPs are useful in whole-genome SNP association studies, in which hundreds of thousands of SNPs across the entire genome are genotyped.

Single-nucleotide polymorphism - Wikipedia

Single nucleotide polymorphism (SNP), variation in a genetic sequence that affects only one of the basic building blocks— adenine (A), guanine (G), thymine (T), or cytosine (C)—in a segment of a DNA molecule and that occurs in more than 1 percent of a population. An example of an SNP is the substitution of a C for a G in the nucleotide sequence AACGAT, thereby producing the sequence AACCAT.
