Most metal hydroxides are insoluble; some such as Ca (OH) 2, Mg (OH) 2, Fe (OH) 2, Al (OH) 3 etc. are sparingly soluble. However, alkali metal hydroxides CsOH, KOH, and NaOH are very soluble, making them strong bases. When dissolved, these hydroxides are completely ionized.

The product is an overall metal solubility diagram containing the solubility curves for 12 metal hydroxides/oxides. The curves are based on a commercially available thermodynamic database and were validated against literature solubility data. In most cases, the curves depict the solubility of the less stable crystalline or amorphous form of the metal hydroxide or oxide. This will be typical of industrial situations where aging of the solid phase is often minimal.

Below is a metal hydroxide solubility curve showing the solubility of the common heavy metal ions and their respective solubility versus pH. If copper is reviewed, it is seen that at a pH of 6 copper has a solubility of 20 mg/l and at a pH of 8.0, the solubility is 0.05 mg/l. Nickel has a similar curve but it occurs at 3 pH points high.

Solubility of the hydroxides. The hydroxides become more soluble as you go down the Group. This is a trend which holds for the whole Group, and applies whichever set of data you choose. Some examples may help you to remember the trend: Magnesium hydroxide appears to be insoluble in water. However, if you shake it with water, filter it and test the pH of the solution, you find that it is slightly alkaline.

Equations 1, 4 and 6 show that the solubility equilibria of metal hydroxides, oxide-hydrates, and oxides all have only the metal ions and hydroxide ions in the solution as dissolution products. This is so because the oxide ion (O^{2-}) is such a strong Brønsted base that it does not exist in aqueous solutions.
