1 Introduction. There are many methods for evaluating the fatigue life of welded structures [1]. In addition to direct experimental methods, procedures based on S-N curves and fatigue crack propagation (FCP) considerations are frequently used. Due to the inherent disadvantage of the S-N curve approach, which cannot describe crack propagation [2], an alt

ernative approach based on Fracture Mechanics (FM) concepts has been developed.

Fracture mechanics and fatigue life assessment of box ...

In welded joints, fatigue cracks can initiate either at the weld toe or the weld root. The latter may be affected by small irregularities or even by non-fused root faces forming a narrow opening which can be considered as an initial crack [1, 5, 6]. The fatigue strength of joints that fail from the root depends on many variables such as weld throat size, plate thickness, and depth of weld penetration.

The welded CFCHS joints in these arch truss bridges are therefore susceptible to fatigue cracking since they are subject to cyclic loads induced by daily traffic. Fatigue is an important issue in designing welded CFCHS joints. Extensive research has been conducted on fatigue of welded tubular joints without infill of concrete (e.g. [3-7]).
