Star topology typically has an active hub with means of echo-related issues in data transfer and is often used for local networks. Routers, switches, or hubs are generally used in this network structure. The central node of the star topology becomes the router, switch, or hub device through which all packets pass.

What is Network Topology? | SYSNETTECH Solutions

A topology is a non-empty set X , and a collection $\mathcal{T}$ of subsets of X satisfying the following three axioms: (i) X and the empty set ϕ , belong to $\mathcal{T}$. (ii) The union of any (finite or infinite) number of sets in $\mathcal{T}$ belongs to $\mathcal{T}$. (iii) The intersection of any finite number of sets in $\mathcal{T}$ belongs to $\mathcal{T}$.

Solution: Let τ be the topology on X . Take $z \in \text{int}(A \cap X)$. So $z \in O$ such that $O \cap A$. But then $z \in O \cap Y$, which is open in Y , and $O \cap Y \cap A$ since $O \cap A$. Thus, $z \in \text{int}(A \cap Y)$. To see that equality need not hold, consider $X = \mathbb{R}$, $Y = [0; 1]$ and $A = (1/2; 1]$. We then have $\text{int}(A \cap X) = (1/2; 1)$ whereas $\text{int}(A \cap Y) = (1/2; 1]$. [6 marks] Question 3

Suppose $x = g_1 h_1 \cdots g_n h_n$ lies in the center of $G * H$, where $g_i \in G$ and $h_i \in H$. For any $g \in G$, we have $g g_1 h_1 \cdots g_n h_n g^{-1} = g_1 h_1 \cdots g_n h_n$. The only way for this to be true for all g is if $h_i = 1_H$ for all i .

Solution: Suppose $\mathcal{A}$ is a basis for a topology τ on X . Let $\{ \tau_i \}_{i \in I}$ be an indexed collection of all topologies on X where $\mathcal{A}$ is contained in each τ_i , and let $\tau = \bigcup_{i \in I} \tau_i$ (which is a topology by exercise 13.4(a)). Suppose that $U \neq \emptyset$ is an open set in τ . We infer from Lemma 13.1 that U
