The equation implies the dimensional relationship, $t = M\alpha(M t^{-2})\beta$ (2.4.2) When we rearrange the equation to combine all the indices of the same dimension together, we get, $-2\beta = 1\alpha + \beta = 0$ Solving for α & β , we have, $\alpha = 1/2$ $\beta = -1/2$ So consequently, $\Gamma = k m^{1/2} c^{-1/2}$.

Dimensional Formula and Dimensional Equation Dimensions All physical quantities can be represented in terms of fundamental quantities; length, mass, time, etc. e.g., We know, Area = length x breadth. Here length and breadth are measured using the unit of length (L). Thus, unit of area = $L \times L = L^2$.

Introduction to Units and Dimensions. Every measurement has two parts. The first is a number (n) and the next is a unit (u). $Q = nu$. For Example, the length of an object = 40 cm. The number expressing the magnitude of a physical quantity is inversely proportional to the unit selected. If n_1 and n_2 are the numerical values of a physical quantity corresponding to the units u_1 and u_2 , then $n_1 u_1 = n_2 u_2$.

Converting between metric units is called unit analysis or dimensional analysis. Unit analysis is a form of proportional reasoning where a given measurement can be multiplied by a known proportion or ratio to give a result having a different unit

or dimension. Algebraically, we know that any number multiplied by one will be unchanged.

Chapter 2 - Physics in Industrial Instrumentation. PDF Version. An interesting parallel to the “unity fraction” unit conversion technique is something referred to in physics as dimensional analysis. Performing dimensional analysis on a physics formula means to set it up with units of measurement in place of variables, to see how units cancel and combine to form the appropriate unit (s) of measurement for the result.

Since this simple arithmetic involves quantities, the premise of dimensional analysis requires that we multiply both numbers and units. As the numbers of these two quantities are multiplied to yield the number of the product quantity, 27.3, similarly, the units are multiplied. Just as for numbers, a ratio of identical units is also numerically equal to one, and the unit product thus simplifies to 1 . When identical units divide to yield a factor of 1 , they are said to “cancel.”

A calorie is a unit of heat or energy and it equals about 4.2 J , where $1 \text{ J} = 1 \text{ kg m}^2 \text{ s}^{-2}$. Suppose we employ a system of units in which the unit of mass equals $\alpha \text{ kg}$, the unit of length equals $\beta \text{ m}$, the unit of time is second, show that a calorie has a magnitude $4.2 \alpha^{-1} \beta^{-2} \gamma^2$ in terms of the new units. Answer: $1 \text{ cal} = 4.2 \text{ kg m}^2 \text{ s}^{-2}$
