Multivariate Analysis of Variance (MANOVA)

Multivariate analysis of variance (MANOVA) designs are appropriate when multiple dependent variables are included in the analysis. The dependent variables should represent continuous measures (i.e., interval or ratio data). Dependent variables should be moderately correlated. If there is no

correlation at all, MANOVA offers no improvement over an analysis of variance (ANOVA); if the variables are highly correlated, the same variable may be measured more than once.

Multivariate analysis of variance (MANOVA) is a statistical analysis used when a researcher wants to examine the effects of one or more independent variables (IVs) on multiple dependent variables (DVs). This method is an extension of the analysis of variance (ANOVA) model and is the most commonly used multivariate analysis in the social sciences.

Multivariate Analysis of Quantitative and Qualitative Traits Variance-components linkage analysis of a collection of discrete and continuous traits can be approached as a form of bivariate (i.e., two-trait) analysis in which one variable represents the (possibly multivariate) discrete-trait state and the other variable represents a (possibly multivariate) correlated quantitative character.

Multivariate analysis of variance (MANOVA) is an extension of the univariate analysis of variance (ANOVA). In an ANOVA, we examine for statistical differences on one continuous dependent variable by an independent grouping variable. The MANOVA extends this analysis by taking into account multiple continuous dependent variables, and bundles them together into a weighted linear combination or composite variable.

MANOVA - Statistics Solutions

Analysis of variance (ANOVA) is a collection of statistical models and their associated estimation procedures (such as the "variation" among and between groups) used to analyze the differences among group means in a sample. ANOVA was developed by the statistician Ronald Fisher. The ANOVA is based on the law of total variance, where the observed variance in a particular variable is partitioned ...

Analysis of variance - Wikipedia

Multivariate Analysis of Variance (or MANOVA) is one particular technique for analyzing such multi- variable models. In MANOVA the goal is to maximally discriminate between two or more distinct groups on a linear combination of quantitative variables.

A TRULY MULTIVARIATE APPROACH TO MANOVA

Multivariate analysis of variance (MANOVA) is simply an ANOVA with several dependent variables. That is to say, ANOVA tests for the difference in means between two or more groups, while MANOVA tests for the difference in two or more vectors of means.

Multivariate Analysis of Variance (MANOVA)

The multivariate analysis of variance (MANOVA) is a complex statistic similar to ANOVA but with multiple dependent variables analyzed together. Like the analysis of variance (ANOVA), the multivariate analysis of variance (MANOVA) has variations. For example, the one-way MANOVA contains a single factor (independent variable) distinguishing participants into groups and two or more quantitative dependent variables.

Multivariate analysis of variance (MANOVA) compares groups on a set of dependent variables simultaneously. Rather than test group differences using several separate ANOVAs and run the risk of increased familywise error (probability of one or more Type I errors), the MANOVA approach makes a single comparison. 1

This monograph considers the multivariate form of analysis of variance (MANOVA) and represents a logical extension of an earlier paper in this series, Analysis of Variance. It provides a unique perspective for readers seeking to understand how MANOVA works and how to interpret MANOVA analyses.
