Using Individual Participant Data Meta-analysis to

Evaluate the Diagnostic Accuracy of the Patient Health Questionnaire-9

"Background: The Patient Health Questionnaire-9 (PHQ-9) has been recommended for screening to identify patients with depression. Conventional meta-analyses on PHQ-9 diagnostic accuracy have been limited by selective cutoff reporting in primary studies and have not examined accuracy for different diagnostic interview types used as reference standards or different participant subgroups. Objectives: To use an individual participant data (IPD) meta-analysis approach to (1) evaluate the association between diagnostic interview method and odds of major depression classification; (2) determine PHQ-9 diagnostic accuracy for different reference standards and participant subgroups; and (3) conduct a simulation to demonstrate variability in optimal cutoffs and the resulting exaggeration of accuracy estimates when small samples are used to select an optimal cutoff and determine its accuracy. Methods: Electronic databases were searched from January 2000 until February 2015 for datasets that compared PHQ-9 scores to major depression classification from validated diagnostic interviews. Primary study data and study-level data extracted from primary reports were synthesized into a large IPD database. To evaluate the association between diagnostic interview method and odds of major depression classification, binomial generalized linear mixed models were fit. To estimate PHQ-9 diagnostic accuracy, bivariate random-effects meta-analyses were used to estimate pooled sensitivity and specificity for cutoffs 5-15. To demonstrate variability in sample-specific optimal cutoffs and resulting exaggeration of accuracy estimates, samples of size 100, 200,

500, and 1000 were drawn with replacement from the IPD database, and optimal cutoffs and their accuracy estimates were compared to those from the full database. Results: Data from 58 of 72 eligible studies were obtained and synthesized (17,436 participants; 2,322 cases). Among fully structured interviews intended for lay administration, odds of major depression were higher for the brief Mini International Neuropsychiatric Interview (MINI) compared to the more in-depth Composite International Diagnostic Interview (CIDI). Compared to semi-structured interviews designed for clinician administration, fully structured interviews (MINI excluded) were less likely to classify major depression among participants with high-level depressive symptoms. PHQ-9 sensitivity estimates compared to semi-structured interviews were greater than compared to fully structured interviews and greater than reported in previous meta-analyses that combined reference standards. A cutoff of ≥ 10 maximized combined sensitivity and specificity overall and for subgroups. When samples of size 100 were drawn from the IPD database, sample-specific optimal cutoffs ranged from 3-19. Compared to estimates based on the full database, sample-specific optimal cutoffs overestimated sensitivity by 10% and underestimated specificity by 4%. When sample size increased to 1000, the range of optimal cutoffs narrowed to 6-12, and sample-specific optimal cutoffs overestimated sensitivity by only 5%; specificity was again underestimated by 4%. Conclusions: Semi- and fully structured diagnostic interviews should not be considered equivalent reference standards for major depression. PHQ-9 diagnostic accuracy compared to semi-structured interviews is greater than previously reported, and a cutoff of $\geq$

10 can be used regardless of participant characteristics. Using data-driven methods to select an optimal cutoff in small samples leads to exaggerated accuracy estimates, although the extent of sensitivity exaggeration reduces as sample size increases. This thesis demonstrated and overcame shortcomings in existing research and generated accurate, unbiased estimates of PHQ-9 diagnostic accuracy. Results can be used to improve our ability to conduct trials that will determine whether screening for depression could be effective"--

Guide to Psychological Assessment with Asians *Springer*

To effectively serve minority clients, clinicians require a double understanding: of both evidence-based practice and the cultures involved. This particularly holds true when working with Asian-Americans, a diverse and growing population. The *Guide to Psychological Assessment with Asians* synthesizes real-world challenges, empirical findings, clinical knowledge and common-sense advice to create a comprehensive framework for practice. This informed resource is geared toward evaluation of first-generation Asian Americans and recent immigrants across assessment methods (self-report measures, projective tests), settings (school, forensic) and classes of disorders (eating, substance, sexual). While the *Guide* details cross-cultural considerations for working with Chinese-, Japanese-, Korean and Indian-American clients, best practices are also included for assessing members of less populous groups without underestimating, overstating or stereotyping the role of ethnicity in the findings. In addition, contributors discuss diversity of presentation within groups and identify ways that language may present obstacles to accurate evaluation. Among the areas covered in this up-to-date reference: Structured and semi-structured clinical interviews. Assessment of acculturation, enculturation and culture. IQ testing. Personality disorders. Cognitive decline and dementia. Mood disorders and suicidality.

Neuropsychological assessment of children, adolescents and adults. Culture-bound syndromes. Designed for practitioners new to working with Asian clients as well as those familiar with the population, the Guide to Psychological Assessment with Asians is exceedingly useful to neuropsychologists, clinical psychologists, health psychologists and clinical social workers.

Brain & Skull Base *Springer Nature*

This book provides a comprehensive overview of the management of brain and skull base tumors. It features detailed insight into the intrinsic molecular biology, anatomical foundation, radiological planning, surgical execution, and the novel therapeutics that guide today's treatment regimens. The first section features concepts related to the epidemiology and pathological basis of disease processes, including relevant cellular and molecular biology. In the second section, integral anatomical foundations and principles are covered including microsurgical anatomy of the cerebrum, white matter tracts, ventricles, brainstem, skull base, advancements in radiological imaging, and cognitive examinations. Surgical approaches and how to execute these procedures are then subsequently discussed in the third part of the work. Principles of Neuro-Oncology: Brain & Skull Base is a practically applicable guide to the latest treatment techniques available to treat these patients. Therefore, it is an indispensable resource for all physicians who

utilize these methodologies in their day-to-day practice.

Population Neuroscience *Springer Science & Business Media*

Is Newton's brain different from Rembrandt's? Does a mother's diet during pregnancy impact brain growth? Do adolescent peers leave a signature in the social brain? Does the way we live in our middle years affect how our brains age? To answer these and many other questions, we can now turn to population neuroscience. Population neuroscience endeavors to identify environmental and genetic factors that shape the function and structure of the human brain; it uses the tools and knowledge of genetics (and the "omics" sciences), epidemiology and neuroscience. This text attempts to provide a bridge spanning these three disciplines so that their practitioners can communicate easily with each other when working together on large-scale imaging studies of the developing, mature and aging brain. By understanding the processes driving variations in brain function and structure across individuals, we will also be able to predict an individual's risk of (or resilience against) developing a brain disorder. In the long term, the hope is that population neuroscience will lay the foundation for personalized preventive medicine and, in turn, reduce the burden associated with complex, chronic disorders of brain and body.
