Pervaporation Vapour Permeation And Membrane

Pervaporation and vapour permeation are membrane-based processes for separating binary or multi-component mixtures of miscellaneous organic fluids. The separation of the mixtures is effected by means of a membrane - the pervaporation membrane.

Introduction to Pervaporation and Vapor Permeation

Vapour permeation and membrane distillation are two emerging membrane technologies, while pervaporation is a well-established technology, which produce a vapour as the permeate. They are of increasing interest to academia and industry due to their potential use in the energy, water, chemical, food and pharmaceutical sectors as efficient separation and concentration processes.

Moreover, membrane vapor permeation (MVP) is suitable for recovery of bioalcohols (bioorganics) from fermentation media. In many cases MVP efficiency is improved by a positive deviation of vapor-liquid equilibrium (VLE) from Raoult's law. The modern approach to vapor separation involves consideration of integrated membrane systems.

A recent review article (Journal of Chemical Technology & Biotechnology 94: 343-365 (2019)) identified several commercially-available permselective materials for drying organic solvents with pervaporation (PV) and vapor permeation (V-P) separation processes. The membrane materials included polymeric and inorganic substances exhibiting a range in the performance characteristics: water permeance, water/solvent selectivity, and maximum use temperature.

Review of pervaporation and vapor permeation process ...

The term pervaporation is a portmanteau of the two steps of the process: (a) permeation through the membrane by the permeate, then (b) its

evaporation into the vapor phase. This process is used by a number of industries for several different processes, including purification and analysis, due to its simplicity and in-line nature.

Pervaporation - Wikipedia

Pervaporation (PV) is a separation process for liquid mixtures by means of a nonporous membrane. The membrane acts as a barrier between a liquid phase (feed) and a vapour phase (permeate). The driving force for the mass transport through the membrane is induced by the vapour pressure difference between the feed solution and the permeate.

Membrane Processes: Pervaporation, Vapor Permeation and ...

Pervaporation is a process where a liquid feed mixture evaporates at a membrane and permeates through the membrane whereas vapor permeation is the permeation of organic vapors or gases through a membrane. Both processes achieve the separation by selectively permeating a particular component to other feed components.

Pervaporation and Vapor Permeation Processes and Systems PERVAP®Composite Membranes because permeate fl ux is lower, more surface is needed. Correct membrane selection is important since it impacts both the cost of the installation and the membrane lifetime. Tests can be performed to select the ideal membrane.

Pervaporation and of Vapor Permeation

Pervaporation (PV) is considered an efficient and indispensable membrane process in liquid separation and in particular for breaking azeotropes of liquid mixtures. It is based on the use of a polymeric or inorganic membrane located at the interface between a liquid feed mixture to be treated and the vapor phase (permeate).

DeltaMem’s PERVAP™ polymeric membranes for dehydration and methanol removal is based on polyvinyl alcohol (PVA) separation layer. The separation layer is cross-linked in different ways to produce a range of hydrophilic membranes suitable for different pervaporation and vapor permeation applications.

Besides PV, vapour permeation (VP) can be used for the separation of methanol-DMC mixtures, either with methanol- or DMC-selective membranes,. Clearly, VP is well suited to the processing of the head streams, such as volatile azeotropes from distillation columns, as no phase transition is required.
