A MODFLOW groundwater-flow model was developed to simulate discharge to streams and springs in the eastern Arbuckle-Simpson aquifer. Horizontal discretization in the model was 200 meters (656 feet) by 200 meters (656 feet), and six layers were used to represent the aquifer over a model area of 1,002 square kilometers (387.1 square miles).

Petroleum hydrogeology
Groundwater flow as a geologic agent mobilizes, transports and deposits hydrocarbons as well. Thus petroleum accumulations can be viewed simply as products of groundwater's moving geologic agency. As a consequence in the 1980s a new discipline was born creating connection between hydrogeology and petroleum geology.

Hydrogeology - Wikipedia

In many parts of the world, groundwater resources are under

increasing threat from growing demands, wasteful use, and contamination. To face the challenge, good planning and management practices are needed. A key to the management of groundwater is the ability to model the movement of fluids and contaminants in the subsurface.

Modeling Groundwater Flow and Contaminant Transport ...

Groundwater flow model calibration is achieved through a trial and error method by adjusting the two key parameters i.e., hydraulic conductivity and recharge rates. During the model calibration 22 observed hydraulic heads measured in April 2006 are used (Fig. 7).
