The degree of indeterminacy i e for internal indeterminacy is given by the following equation: $(4) i e = 3 m + r - (3 j + e c)$ As it was for external determinacy, if this equation results in $i e = 0$, the structure is determinate; if it results in $i e < 0$, then the structure is unstable.

Force Method for Analysis of Indeterminate Structures

An indeterminate structure is one whose unknown forces cannot be determined by the conditions of static equilibrium alone and will require, in addition, a consideration of the compatibility conditions of different parts of the structure for its complete analysis. Furthermore, structures must be stable to be able to serve their desirable functions.
