Therefore, the solubility of a gas decreases as the temperature increases. Solubility curves can be used to determine if a given solution is saturated or unsaturated. Suppose that 80 g of KNO₃ is added to 100 g of water at 30°C. According to the solubility curve, approximately 48 g of KNO₃ will dissolve at 30°C. This means that the solution will be saturated since 48 g is less than 80 g.

The solubility of the majority of solid substances increases as the temperature increases. However, the effect is difficult to predict and varies widely from one solute to another. The temperature dependence of solubility can be visualized with the help of a solubility curve , a graph of the solubility vs. temperature (see figure below).

Solubility graphs represent the relationship between solubility (in grams of solid per volume of water) vs temperature. If the solution is above the solubility line it is supersaturate and below the solubility line it is unsaturated. Points along the line are points of saturation.

temperature, pressure, concentration of common ions in solution, complexation, the ion strength of the solution, crystal size, etc. The solubility of gases is inversely proportional to temperature, i.e. it decreases with temperature. At a constant temperature, the solubility of gases is met by Henry's law:

CALCULLA - Table of substances solubility by temperature

The variation of solubility for a gas with temperature can be determined by examining the graphic on the left. As the temperature increases, the solubility of a gas decrease as shown by the

downward trend in the graph . More gas is present in a solution with a lower temperature compared to a solution with a higher temperature.

An equivalent way of stating the law is that the solubility of a gas in a liquid is directly proportional to the partial pressure of the gas above the liquid: $C = k P_{\text{gas}}$ where C is the solubility of a gas at a fixed temperature in a particular solvent (in units of M or mL gas/L) k is Henry's law constant (often in units of M/atm)

Reading solubility graphs

The temperature dependence of solubility can be visualized with the help of a solubility curve, which is a graph of the solubility vs. temperature. Examine the solubility curves shown (see figure below). Figure 4: A solubility curve is a graph of the solubility of a substance as a function of temperature. Notice how the temperature dependence of NaCl is fairly flat, meaning that an increase in temperature has relatively little effect on the solubility of NaCl .

Notice how NaCl's solubility is relatively constant regardless of temperature, whereas Na₂SO₄'s solubility increases exponentially over 0-35 degrees

Solubility Vs Temperature Graphing Interpolation Answers

Reading and Interpreting Solubility Graphs As we already know, solubility is the amount of solute that will dissolve in a given amount of solvent at a particular temperature. The latter part of this statement is significant since, for many solutes, the solubility will increase as the temperature is increased.
