Parametric Equations Of Curves

In mathematics, a parametric equation defines a group of quantities as functions of one or more independent variables called parameters. Parametric equations are commonly used to express the coordinates of the points that make up a geometric object such as a curve or surface, in which case the equations are collectively called a parametric representation or parameterization of the object. For example, the equations
$$\begin{aligned}x&=\cos t\\y&=\sin t\end{aligned}$$

Calculus II - Parametric Equations and Curves

Parametric equations can be used to describe all types of curves that can be represented on a plane but are most often used in situations where curves on a Cartesian plane cannot be described by

functions (e.g., when a curve crosses itself). Parametric equations are also often used in three-dimensional spaces, and they can equally be useful in spaces with more than three dimensions by implementing more parameters.

Parametric equation | mathematics | Britannica

In the two-dimensional coordinate system, parametric equations are useful for describing curves that are not necessarily functions. The parameter is an independent variable that both x and y depend on, and as the parameter increases, the values of x and y trace out a path along a plane curve.

10.1: Curves Defined by Parametric Equations - Mathematics ...

One of the reasons we parameterize a curve is because the parametric equations yield more information: specifically, the direction of the object's motion over time. When we graph parametric equations, we can observe the individual behaviors of x and of y .

To find the cartesian equation of a curve from its parametric equations you need to eliminate the parameter. Note: it is not always possible to find the cartesian equation of a curve defined parametrically. Step 1 Make t the subject of one of the parametric equations. Step 2 Substitute your equation for t into the other parametric equation.

Parameterization of Curves in Three-Dimensional Space. Sometimes we can describe a curve as an equation or as the intersections of surfaces in $\mathbb{R}^3$, however, we might rather prefer that the curve is parameterized so that we can easily describe the curve as a vector equation. We will now look at some examples of parameterizing curves in $\mathbb{R}^3$.

A Bézier curve (/ 'bez.i.eɪ / BEH-zee-ay) is a parametric curve used in computer graphics and related

fields. The curve, which is related to the Bernstein polynomial, is named after Pierre Bézier, who used it in the 1960s for designing curves for the bodywork of Renault cars. Other uses include the design of computer fonts and animation.

Hence equations (1) and (2) together also represent a circle centred at the origin with radius a and are known as the parametric equations of the circle. q is known as the parameter. As q varies between 0 and 2π , x and y vary. It is often useful to have the parametric representation of a particular curve.

Parametric Equations - Mathematics A-Level Revision

A parametric equation is where the x and y coordinates are both written in terms of another letter. This is called a parameter and is usually given the letter t or θ . (θ is normally used when the parameter is an angle, and is measured from the positive x -axis.)
