The graph of the function g is shown below. What is the input value for which g of x is equal to negative 2? So what they do here is along the x axis these are the inputs and then the graph shows us what's the output so when x is equal to 7, G of 7 we see here is 1. If x equals 9, g of 9 here is 2.

Matching Algorithms (Graph Theory) Matching algorithms are algorithms used to solve graph matching problems in graph theory. A matching problem arises when a set of edges must be drawn that do not share any vertices. Graph matching problems are very common in daily activities. From online matchmaking and dating sites, to medical residency placement programs, matching algorithms are used in areas spanning scheduling, planning, pairing of vertices, and network flows.

In the bottom area, enter the values to match the generated graph to your graph. Your function expression is corrected when the graphs match (graph will be green). You can use the arrows to increase and decrease your values or type them in directly with the keyboard. Check checks to see if all your values are correct.

Function Matching - Illuminations

Prerequisite – Graph Theory Basics Given an undirected graph, a matching is a set of edges, such that no two edges share the same vertex. In other words, matching of a graph is a subgraph where each node of the subgraph has either zero or one edge incident to it. A vertex is said to be matched if an edge is incident to it, free otherwise.
