Transformation of waste biomass to various biotechnological products and bioenergy is carried out through different routes. The major routes comprise biological, chemical, and thermal processes and are depicted in Fig. 1.5. The conversion of biomass either can result in final products or may provide building blocks for further processing.

The technologies of food waste aerobic bioconversion into fertilizer (Wang et al., 2003) and food waste anaerobic bioconversion into biogas and fertilizer (Wang et al., 2002) were developed. Production of yeast biomass using extracts of easily dissolved organic matter from vegetable and food processing wastes was proposed as a first step of the technology for food waste bioconversion into value-added by-product followed by

aerobic or anaerobic treatment of solid residue.

Conversion of these wastes into combustible biomass briquettes would provide a means to satisfy individual energy needs while alleviating landfill use[2,3]. Further, lumber has become a scarce

resource in many regions of the world, and there is a pressing need for sustainable fuels to augment or replace traditional wood fuels[4].

Biotransformation also serves as an important defense

mechanism since toxic xenobiotics and body wastes are converted into less harmful substances and substances that can be excreted from the body. Toxicants that are lipophilic, non-polar, and of low molecular weight are readily absorbed through the cell membranes of the skin, GI tract, and lung.
