During the 1970s and '80s, however, four techniques emerged as being most useful for real-world surface analysis because of their general applicability and ease of use. The use of photons in and electrons out provides X-ray photoelectron spectroscopy (XPS, or electron spectroscopy for chemical analysis [ESCA]).

A Hanford scientist uses an Auger electron spectrometer to determine the elemental composition of surfaces. Auger electron spectroscopy (AES; pronounced [oʒe] in French) is a common analytical technique used specifically in the study of surfaces and,

more generally, in the area of materials science.

Auger electron spectroscopy - Wikipedia

Auger electron spectroscopy (AES) is a surface-specific analytical technique that utilizes a high-energy, finely-focused electron beam as an excitation source. Auger electrons are produced when the excited atoms release the extra energy to an electron that is then emitted as an Auger electron.

Auger Electron Spectroscopy (AES) provides quantitative elemental and chemical state information from surfaces of solid materials. The average depth of analysis for an AES measurement is approximately 5 nm.

Physical Electronics Auger instruments provide the ability to obtain spectra with a lateral spatial resolution as small as 8 nm.

Auger Electron Spectroscopy (AES) Surface Analysis Technique

Reflected electron energy loss spectroscopy (REELS) is a technique used to probe the electronic structure of the material at the surface. It works in a similar fashion to ISS, but in this case, the incident particle is an electron, and it is the scattered electron beam that is measured.

X-ray photoelectron spectroscopy (XPS) is a surface-sensitive quantitative spectroscopic technique based on the photoelectric effect that can identify the

elements that exist within a material (elemental composition) or are covering its surface, as well as their chemical state, and the overall electronic structure and density of the electronic states in the material.

X-ray photoelectron spectroscopy - Wikipedia

The electron effective attenuation length (EAL) can be defined for the measurement of overlayer film thicknesses (the most common application) and for the

measurement of the depth of a thin marker layer by Auger electron spectroscopy (AES) and x-ray photoelectron spectroscopy (XPS).
