Friction is a force that resists the relative motion between two objects. The

simplest form is dry friction, which is equal to $F_f = \mu F_N$ μ is the coefficient of friction and F_N is the normal force. The coefficient of friction is experimentally determined and is specific to the two materials in contact. In many materials, the coefficients of kinetic friction (when the objects are ...

Friction points up because the block slides down, and friction always points in the opposite direction from the motion. Now add up the forces in each direction (x and y) and set their sums equal to the block's mass times its acceleration along that particular axis ($a_y = 0$ meters per second squared because the block doesn't accelerate off the ramp's surface or into it).
