Rail stresses occur due to the load of the wheels that pass through. In order to avert accidents this stress is calculated and is based on the theory of elasticity. Modulus is applied in different equations to find the track stresses. Read on to get an idea of rail

What is Rail Stress? - Bright Hub Engineering

Stressing is a rail engineering process. It is used to prevent heat and cold tension after installation of continuous welded rail. Environmental heat causes CWR to expand and therefore can cause the fixed track to buckle. Environmental cold can lead to the contraction of the fixed rail causing brittleness and cracks. Before it is installed, the rail is altered by stretching with hydraulic tensors or heated to its Stress-Free Temperature to make these dangerous problems less likely.

STRESSES IN RAILROAD TRACK. With

the constant tendency in railroad practice to increase the axle loading and the speed of locomotives, the problem of stresses produced in rails by moving loads becomes more and more important. In a study made by engineers of the Westinghouse Electric and Manufacturing Company, principally in connection with the study of the tracking characteristics of electric locomotives, there has been developed a method for experimental determination, not only of vertical ...

STRESSES IN RAILROAD TRACK - TRID

The magnitude of these stresses is dependent on the track system, wheel/rail

contact, top-of-rail friction and the thickness of material left in the head of the rail. But no matter how you slice it, the rail investment cannot be properly managed without understanding its stress environment.

Understanding Stresses in Rails (Part 2 of 2) - Interface ...

Stresses and wear are directly related to the life of the rail and susceptibility of the rail to fatigue damage. If the stress is external, such as contact or dynamic stresses, the rail will wear or fracture. If the stress is internal, such as residual or thermal stresses, it can accelerate the growth of fatigue defects, again causing fracture.

Understanding Stresses in Rails (Part 1 of 2) - Interface ...

Scientific design of a railway track formation requires an understanding of the subgrade behavior and the factors affecting it. These include the effective resilient stiffness during train passage, which is likely to depend on the stress history and the stress state of the ground, and the stress path followed during loading.

Forces Acting on the Track A rail is subjected to heavy stresses due to the following types of forces. (a) Vertical loads consisting of

dead loads, dynamic augment of loads including the effect of speed, the hammer blow effect, the inertia of reciprocating masses, etc.

Forces Acting on the Railway Track - BrainKart

However, in countries typically hotter than ours, rails are stressed to withstand higher temperatures. Hot weather can cause a great deal of disruption to the railway so Britain's rails are pre-stressed to help them resist high temperatures. Our rails have a stress-free temperature of 27 degrees – the UK mean summer rail temperature.

Why rails buckle in Britain - Network Rail

The track on a railway or railroad, also known as the permanent way, is the structure consisting of the rails, fasteners, railroad ties (sleepers, British English) and ballast (or slab track), plus the underlying subgrade. It enables trains to move by providing a dependable surface for their wheels to roll upon. For clarity it is often referred to as railway track (British English and UIC ...

Abstract. The technology of continuously welded rails (CWRs) is important in modern railway track structures. To measure rail stress, resistance strain gauges are preferred due to their good stability, sensitivity, and resistance to external interference. Based on the bi-directional strain method, we present a new method for measuring longitudinal rail stress using resistance strain gauges and develop a monitoring device for rail stress to realize

long-term and multi-point measurement.
