Elliptic-curve cryptography is an approach to public-key cryptography based on the algebraic structure of elliptic curves over finite fields. ECC allows smaller keys compared to non-EC cryptography to provide equivalent security. Elliptic curves are applicable for key agreement, digital signatures, pseudo-random generators and other tasks. Indirectly, they can be used for encryption by combining the key agreement with a symmetric encryption scheme. They are also used in several integer factoriza

Introduction. Elliptic Curve Cryptography is an exciting and promising method of encrypting data which achieves the same, or better, strength with far smaller key lengths than traditional encryption methods such as RSA. Elliptic Curves are themselves not rocket science, but the plethora of articles and mathematical background out there do leave it somewhat as "a non-trivial exercise to the casual reader" to actually see how the scheme can be implemented and used.

ECDSA is an asymmetric cryptography algorithm that's constructed around elliptical curves and an underlying function that's known as a "trapdoor function." An elliptic curve represents the set of points that satisfy a mathematical equation ($y^2 = x^3 + ax + b$). The elliptical curve looks like this:
