The curved arrow in structure A represents the type 3 resonance "motion" - the pi bond between the carbon and oxygen breaks to form another lone pair on the oxygen. The curved arrow in structure B represents type 2 resonance "motion" - the pi bond breaks to form a new pi bond to the carbocation carbon. In structure C, there are two curved arrows.

These two structures are called resonance structures or resonance forms of the same compound. Resonance structures are separated by a double-headed arrow. Do not use two arrows as they are used for equilibrium reactions. Notice again, that only the arrangement of electrons is different in resonance structures - atoms have the same connectivity. And that is the definition of identical compounds - they must have the same connectivity of atoms.

Resonance structures are sets of Lewis structures that describe the delocalization of electrons in a polyatomic ion or a molecule. In many cases, a single Lewis structure fails to explain the bonding in a molecule/polyatomic ion due to the presence of partial charges and fractional bonds in it. In such cases, resonance structures are used to describe chemical bonding.
