The volume examines early cellular evolution, explores changes in the tempo of evolution between the Precambrian and Phanerozoic periods, and reconstructs the Cambrian evolutionary burst.

...

The basic mechanisms that produce evolutionary change are natural selection and genetic drift; these two mechanisms act on the genetic variation caused by mutation, genetic recombination and gene flow. Through genetic drift the frequency of heritable traits changes randomly and through natural selection organisms with traits that help them to survive and reproduce will have more offspring passing those traits on to the next generation.
