Experiment 81 - Design of a Feedback Control System

1.3 Design of Feedback Control Systems. Feedback control systems must be designed to suit a predetermined purpose. Normally, only the controller can be appropriately designed, whereas the process and the sensor are predetermined or constrained. Feedback control systems can be designed to achieve specific behavior of the output variable, for example.

Analysis and Design of Feedback Control Systems ...

An improved methodology for designing feedback control systems has been developed based on systematically shaping the loop gain of the system to meet performance requirements such as stability margins, disturbance attenuation, and transient response, while taking into account the actuation system limitations such as actuation rates and range.

Practical Loop-Shaping Design of Feedback Control Systems

There are two main types of feedback control systems: negative feedback and positive feedback. In a positive feedback control system the setpoint and output values are added. In a negative feedback control the setpoint and output values are subtracted. As a rule negative feedback systems are more stable than positive feedback systems. Negative

Shunt-Series Feedback Systems. Shunt-Series Feedback, also known as shunt current feedback, operates as a current-current controlled feedback system. The feedback signal is proportional to the output current, I_o flowing in the load. The feedback signal is fed back in parallel or shunt with the input as shown. Shunt-Series Feedback System

Feedback Systems and Feedback Control Systems

The design of feedback control systems is then introduced together with the ideas of disturbance rejection, multivariable systems and design tradeoffs. The lectures are complemented by a set of in-depth design examples in which the techniques presented in the course material are used to solve real problems.

(PDF) Control Systems in Robotics: A Review

The PID controller is probably the most-used feedback control design. If $u(t)$ is the control signal sent to the system, $y(t)$ is the measured output and $r(t)$ is the desired output, and
$$e(t) = r(t) - y(t)$$
 is the tracking error, a PID controller has the general form

Control theory - Wikipedia

A feedback is a common and powerful tool when designing a control system. Feedback loop is the tool which take the system output into consideration and enables the system to adjust its performance to meet a desired result of system. In any control system, the output is affected due to change in environmental condition or any kind of disturbance.

...

In many control system designs, it is possible to use either open loop control or feedback control. Feedback control systems measure the system parameter being controlled and use that information to determine the control actuator signal. Open loop systems do not use feedback. All the systems described in Table 1.1 use feedback control.

Control System Basics | Ledin Engineering, Inc.

The design of feedback control systems up through the Industrial Revolution was by trial-and-error together with a great deal of engineering intuition. Thus, it was more of an art than a science. In the mid 1800's mathematics was first used to analyze the stability of feedback control systems.

Control Systems can be classified as open loop control systems and closed loop control systems based on the feedback path. In open loop control systems, output is not fed-back to the input. So, the control action is independent of the desired output. The following figure shows the block diagram of the open loop control system.
