The way to solve a linear equation is to rewrite it in such a form that on the one side of the equality sign we end up with one term only containing x , and on the other side we have one term which is a constant. To achieve this we can perform several operations. First of all we can add or subtract a number on both sides of the equation.

Which of the following choices of a will result in a system of equations with no solutions? No solutions. So a system has no solutions if both lines and these are both linear equations, they actually tell us these are linear equations, is if you have two lines that are parallel, then you have no solutions. They are never going to intersect.

If $a = b$ $a = b$ then $a - c = b - c$ $a - c = b - c$ for any c c . As with the last property we can subtract a number, c c , from both sides of an equation. If $a = b$ $a = b$ then $ac = bc$ $a c = b c$ for any c c . Like addition and subtraction, we can multiply both sides of an equation by a number, c c , without changing the equation.

A linear equation is an equation for a straight line. These are all linear equations: $y = 2x + 1$: $5x = 6 + 3y$: $y/2 = 3 - x$: Let us look more closely at one example: Example: $y = 2x + 1$ is a linear equation: The graph of $y = 2x+1$ is a straight line . When x increases, y increases twice as fast, so we need $2x$;
