Construct a regular hexagon if we know the radius of circumscribed circle. This is even easier. We just draw the circle $c(O, r)$ and pick a starting point on it, let it be point A. In regular hexagon, we know that the radius of circumscribed circle is equal to side of polygon, meaning $r = |AO| = |AB|$.

In mathematics, a constructible polygon is a regular polygon that can be constructed with compass and straightedge. For example, a regular pentagon is constructible with compass and straightedge while a regular heptagon is not. There are infinitely many constructible polygons, but only 31 with an odd number of sides are known.
