Natural Killer Cells At The

Natural killer cells, also known as NK cells or large granular lymphocytes, are a type of cytotoxic lymphocyte critical to the innate immune system. The role of NK cells is analogous to that of cytotoxic T cells in the vertebrate adaptive immune response. NK cells provide rapid responses to virus-infected cells, acting at around 3 days after infection, and respond to tumor formation. Typically, immune cells detect the major histocompatibility complex presented on infected cell surfaces, trigger

Natural killer cell - Wikipedia

Philipp Eissmann, Imperial College, London, UK Natural Killer (NK) Cells are lymphocytes in the same family as T and B cells, coming from a common progenitor. However, as cells of the innate immune system, NK cells are classified as group I Innate Lymphocytes (ILCs) and respond quickly to a wide variety of pathological challenges.

Natural Killer Cells | British Society for Immunology

Natural killer cells are aggressive cells of

the immune system that play an important role in fighting cancer as well as viral-infected cells. While T cells are also important in cancer, natural killer cells are the "first responders" that are on the scene before the T cells are summoned. Not yet in use with other immunotherapy drugs, researchers are looking at ways to harness the actions of natural killer cells as they have T cells.

Natural Killer Cells and Cancer Immunity

NK cells play a major role in the host-rejection of both tumours and virally infected cells. Natural killer cells are cytotoxic; small granules in their cytoplasm contain special proteins such as perforin and proteases known as Granzymes. Upon release in close proximity to a cell slated for killing, perforin forms pores in the cell membrane of the target cell through which the granzymes and associated molecules can enter, inducing apoptosis.
