Polynuclear Aromatic Hydrocarbons Chemistry And
A polynuclear aromatic hydrocarbon is a hydrocarbon made up of fused aromatic ring molecules. These rings share one or more sides and contain delocalized electrons. Another way to consider PAHs is molecules made by fusing two or more benzene rings. Polynuclear aromatic hydrocarbon molecules contain only carbon and hydrogen atoms.

A polynuclear aromatic hydrocarbon is a hydrocarbon whose molecule contains two or more fused benzene rings.

Polynuclear Aromatic Hydrocarbon - Chemistry LibreTexts
Polycyclic aromatic hydrocarbons (PAHs) are sometimes referred to as polynuclear aromatic hydrocarbons (PNAs), condensed ring aromatics, or fused ring aromatics. They are a class of organic compounds consisting of two or more fused aromatic rings. Polycyclic aromatic hydrocarbons most commonly encountered in the environment contain two (naphthalene) to seven (coronene) fused benzene rings, though PAHs with greater number of rings are also found.

Polycyclic Aromatic Hydrocarbon - an overview ...

The terms polycyclic aromatic hydrocarbons and polynuclear aromatic hydrocarbons refer to the same group of organic compounds that contains several cyclic structures of carbon and hydrogen are fused with each other forming a large organic molecule. However, the difference between polycyclic and polynuclear aromatic hydrocarbons lies on the description given by each term; polycyclic refers to “many cycles” while polynuclear refers to “many atoms”.

Metals and polynuclear aromatic hydrocarbons (PAH) may be elevated around oil and gas production platforms, including those in the Gulf of Mexico (Kennicutt et al. 1996; Peterson et al. 1996). The exposure of sediment-dwelling organisms to metal and PAH mixtures may result in toxic endpoints that differ from exposure to individual contaminants.

A polycyclic aromatic hydrocarbon (PAH) is a hydrocarbon —a chemical compound containing only carbon and hydrogen—that is composed of multiple aromatic rings. The group is a major subset of the aromatic hydrocarbons. The simplest of such chemicals are naphthalene, having two aromatic rings, and the three-ring compounds anthracene and phenanthrene.

The aromatic hydrocarbons are “ unsaturated hydrocarbons which have one or more planar six-carbon rings called benzene rings, to which hydrogen atoms are attached with the general formula CnHn” . Many aromatic hydrocarbons contain a benzene ring (also referred to as an aromatic ring). The benzene ring is stabilized by resonance and the pi electrons are delocalized in the ring structure.

Chemistry polycyclic compounds - SlideShare

Polycyclic aromatic hydrocarbons (PAHs) are a class of chemicals that occur naturally in coal, crude oil, and gasoline. They also are produced when coal, oil, gas, wood, garbage, and tobacco are burned. PAHs generated from these sources can bind to or form small particles in the air.

Polycyclic Aromatic Hydrocarbons (PAHs) Fact Sheet

Chemical Classification: Hydrocarbons (contain hydrogen and carbon atoms) Summary: Polycyclic aromatic hydrocarbons (PAHs) are a group of over 100 different chemicals that are formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat. PAHs are usually found as a mixture containing two or more of these compounds, such as soot.

Polycyclic Aromatic Hydrocarbons (PAHs) - Toxic Substances

Vigorous reactions, sometimes amounting to explosions, can result from the contact between aromatic hydrocarbons and strong oxidizing agents. They can react exothermically with bases and with diazo compounds. Substitution at the benzene nucleus occurs by halogenation (acid catalyst), nitration, sulfonation, and the Friedel-Crafts reaction.
