The lower the water sorptivity index, the better is the potential durability of the concrete. Sorptivity values typically vary from approximately 5 mm/√h, for well-cured M30-M50 concretes, to 15 - 20 mm/√h for poorly cured M20 concrete. A diagram of the test is shown in Figure 2.

Performance Based Design for Durability - The Concrete Portal

Durability is defined as the capability of concrete to resist weathering action, chemical attack and abrasion while maintaining its desired engineering properties. It normally refers to the duration or life span of trouble-free performance. Different concretes require different degrees of durability depending on the exposure environment and properties desired.

Throughout history, concrete has proven itself to be a most flexible and durable construction material. Today, modern technology has led to high performance concrete with super-tensile load qualities. Also, by the substitution of Portland cement with fly ash (fa) or ground granulated blast-furnace slag (ggbs) in the mix, the resulting concrete is stronger still and often used in bridges or in structures exposed to corrosive sea salts.

High-strength concrete is defined based on its compressive strength at a given age whereas high-

performance concrete is defined based on performance criteria namely: high durability, high strength, and high workability. High-performance concrete is defined as a concrete that meets special combination of performance and uniformity requirements that cannot always be achieved routinely using conventional constituents and normal mixing, placing, and curing practice.
