Approaches to Left Atrial Appendage Exclusion

The left atrial appendage (LAA) is derived from the left wall of the primary atrium, which forms during the fourth week of embryonic development. It has developmental, ultrastructural, and physiological characteristics distinct from the left atrium proper. The LAA lies within the confines of the pericardium in close relation to the free wall of the left ventricle and thus its emptying and filling may be significantly affected by left ventricular function.

The left atrial appendage (LAA) is the

usual source for clot that embolizes. (See 'Rationale' below.) Percutaneous approaches, often referred to as LAA exclusion procedures, that mechanically prevent embolization of LAA thrombi have been developed and tested and are discussed in this topic.

Atrial fibrillation: Left atrial appendage occlusion ...

Left Atrial Appendage Closure Devices Percutaneous LAA occlusion is a nonpharmacological alternative to oral anticoagulation which has been studied in a few clinical trials. The rationale behind LAA occlusion comes from anatomic and echocardiographic findings identifying the LAA as the site of thrombus formation in over 90% of patients with nonvalvular AF (Blackshear and Odell, 1996).
